

**Is 2012 the end of the world?  
Are we heading towards Lemuria or Mu type disaster?**

A lot of people are listening and worrying about the world coming to an end in 2012. Hollywood is unleashing a raft of movies about humanity tottering on the edge of extinction.

Is 2012 the end of the world? Humans are particularly good at spreading the bad news the reason why it spreads like wildfire. With regard to the predictions of 2012, we're into the dessert part. No one has anything to present and we're still swallowing the end of life like it's on sale at Wal-Mart.

Solar experts from around the world monitoring the sun have claimed that our sun is in a bit of strife. The energy output of the sun is, like most things in nature, cyclic, and it's supposed to be in the middle of a period of relative stability. However, recent solar storms have been bombarding the Earth with so much radiation energy, it's been knocking out power grids and destroying satellites. This activity is predicted to get worse, and calculations suggest it'll reach its deadly peak sometime in 2012.

The other interesting theory is that scientists in Europe have been building the world's largest particle accelerator. Basically it's a 27km tunnel designed to smash atoms together to find out what makes the Universe tick. However, the mega-gadget has caused serious concern, with some scientists suggesting that it's properly even a bad idea to turn it on in the first place. They're predicting all manner of deadly results, including mini black holes. So when this machine is fired up for its first serious experiment in 2012, the world could be crushed into a super-dense blob the size of a basketball.

Is our earth really going to end in 2012? Lots of queries and questions are coming regarding what will happen in 2012. Will we survive? Or it is just a hoax. To me in nature there is no such off and on switching of disaster. All the past scientific and geological researches show the end of the earth cannot happen in few minutes or days. Even today if any asteroids or meteorites struck the earth, complete extinction may take the time of 100 to 1000 years.

Earth cannot be destroyed completely at one time. It may pass through different changes. Either in the form of climate changes, extinction of some old species or submergence of land in the sea due to sea level rise.

Earlier reports say that some old cities or civilizations submerged beneath the sea like Dwarka in India or the Atlantis civilization.

Dwarka is an important city for Hindu Pilgrimage. It was the fabled capital city of Lord Krishna. This "under sea city of Dwarka" lies in close proximity to near the present Dwarka temple in Saurashtra in India. According to archeologists this under-sea city was the real Dwarka where Lord Krishna lived.

According to ancient concept Dwarka submerged into the sea after Sri Krishna left for the heavenly abode. The search for the lost city of Dwarka began as early as in 1930's. Marine Archaeology Unit (MAU) of the National Institute of Oceanography took part in this search in 1983. The search was carried out in the coastal waters of Dwarka in Gujarat. The well-fortified township of Dwarka that extended more than half a mile from the shore was discovered from 1983 to 1990.

What will happen in 2012 no body knows. It's only a speculations or imaginations based on some mythological concept and not scientific. Every religion talks about some disaster in the ancient past either in the form of floods or in the form of fire from the sky. But scientifically it is not proved.

What will happen if the earthquake of 8 magnitude or more on Richter scale takes place on the earth? It may bring destruction to the specific area. If it takes place beneath the ocean it may bring destruction to bigger area in the form of tsunami but not the complete earth.

Even if great volcanoes erupts it may have the effect on hundreds kilometer. Earth can only be destroyed completely when all events like major earthquakes, volcanoes, shifting of magnetic poles, impact of asteroids or meteorites takes place at the same time in different parts of the earth. Which I am sure is not going to happen.

OK if we are bound to imagine that in year 2012 something is going to happen then what will be the outcome? We can say that the lands may be submerged in the sea either due to Tsunamis or due to the impact of some big object from the outer space. If we believe on the earlier researches there were two imaginary continents which are now under the sea waves. Researchers claim that they vanished due to some natural disasters.

We have all heard about the imaginary islands of Lemuria and Mu which according to different researchers and thinkers are now under the sea.

Researchers say that these islands were submerged in the ocean due to sudden disaster. If something is really going to happen in 2012 are we heading towards the future similar to that of Lemuria or Mu.

Atlantis is by no means the only submerged continent to attract the attention of archaeologists, scientists and historians. Of the remainder the two most important are Mu (on the bed of the Pacific ocean) and Lemuria, beneath the Indian Ocean. There is also the lost land of Pan below the north Pacific, which antedated Mu over 20,000 years, while Mu itself existed 50,000 years ago. The origins of Lemuria apparently go back 100,000 years or more. All ( as in the case of Atlantis) are claimed to be the original birth place of man, though this clearly cannot be so.

Atlantis has been described as the greatest of all historical mysteries. Plato, writing about 350 BC, was the first to speak of the great island in the Atlantic ocean which had vanished "in a day and a night", and been submerged beneath the wave of the Atlantic.

The exact location of Lemuria varies with different researchers and authors. Wherever you believe the location of Lemuria to be, it is linked with the Ring of Fire. Researchers claim that this area has become active with Tsunami in December 26, 2004, powerful earthquakes and volcanoes that continue, after being dormant for many years. It would seem that the legends of ancient Lemuria speak to us once again with warning signs- as they supposedly did to the Lemurians- before the continent-or group of islands-fell into the sea.

Mu is supposedly a continent that sink in the Pacific Ocean, rather than the Atlantic. The British archaeologist James Churchward made this claim in 1926. In his report he

described a country with a far superior culture that had disappeared together with its continent in the aftermath of volcanic eruption.

Even if something related to the concept of 2012 is going to happen we are sure that it is going to affect only small part of the earth and not the whole planet.

It is also true that nothing natural will destroy the earth. It is we human who will be responsible for the destruction of our mother planet, either in the form of nuclear explosion, carbon dioxide emission or other green house gases emission.
